

Hydraulic grab splitter

Tecnomeccanica is pleased to introduce the new **trunk splitting grab**.

Made from Domex 710 steel and equipped with lock valve

This is a new product in our forestry line. The trunk splitting grab is available in 3 models and can be hitched to the forestry loader or other machinery.

It is a grab capable of splitting trunks of considerable dimensions (in terms of diameter and length) with irregular shapes or unusual inner knots and veining. Thanks to its small size, it can be easily transported when hitched to a forestry loader or trailer, even if loaded.

This wood chip is practical enough to be used by only one operator, resulting in considerable savings in costs and time.

The trunk splitting grab is also available in a carriage version that allows the trunk to be split and immediately piled up in that the crane works with its loading grab completely independently.

Tractor-drawn version with extendable and articulated tiller
